Variphy As-Built Reporting for Webex Calling

A complete, readable record of your Webex Calling configuration, ready when you need it.

Control Hub has no as-built export, so documenting a Webex Calling environment means clicking through settings pages and copying details into spreadsheets by hand. Variphy pulls your configuration directly from Webex and builds the report for you, on demand or on a schedule.

Complete Configuration Coverage

- **Document** core inventory, including locations, phone numbers, calling users, workspaces, virtual lines, and licenses with counts, usage, and assignments.
- **Capture** devices, device settings, and DECT networks, including device assignments by user.
- **Report** on calling features such as auto attendants, call queues, hunt groups, schedules, and AI Receptionists.
- **Include** call routing, emergency services, and org and location settings in the same report.

Reporting & Delivery

- **Select** only the datasets you need and save report definitions for reuse.
- **Run** reports on demand or on a recurring schedule.
- **Deliver** reports by email or FTP.
- **Export** to XLSX for filtering and sharing.

Why Variphy?

Readable Output

Every reference appears by name, with no raw Webex IDs to look up in Control Hub.

Clear Dataset Status

Each dataset shows whether it is empty, not applicable, or unavailable, so an unlicensed feature never looks like a missing configuration.

Read-Only Access

Variphy reads your Webex Calling configuration and never changes it.

Automated Documentation

Keep documentation for audits, onboarding, and team handoffs current without manual work.

Variphy turns Webex Calling documentation from a manual project into a report your team can run anytime.
