

Manage Your Entire Webex Calling Environment in One Platform

Provision faster, see who changed what and when, and export a complete as-built record of your configuration, all from one platform.

Variphy brings provisioning, as-built reporting, and audit log for Webex together. Your team manages the whole environment without moving between Control Hub sections or keeping manual spreadsheets up to date.

Provisioning

Combine virtual line, device, and user operations into a single job instead of moving between sections of Control Hub. Configure call settings inline as you create a virtual line, so it launches ready to use, and run high-volume workflows with consistent results.

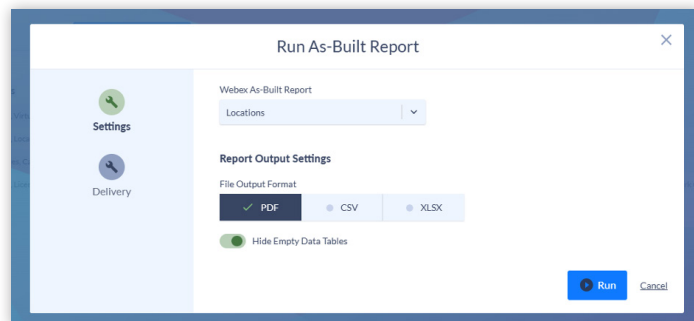

Audit Log and Change History

Control Hub shows the current state but not what changed or who changed it. Variphy records every administrative change with the actor, the action, and the timestamp, then retains it long term, so a change from months ago is still there when an audit needs it.

As-Built Reporting

Generate an as-built report of your complete Webex Calling configuration whenever you need current evidence. Variphy captures 43 object types in every snapshot, so the record is complete without tracking down each setting by hand. Export it in PDF, CSV, or XLSX for audits, onboarding, and team handoffs.
