

Variphy Configuration Change Monitoring for CUCM, Unity, and UCCX

Audit Log Reporting | Change Management | Snapshots | As-Built Reporting

Many CUCM teams rely on logs only after something goes wrong, forcing administrators to manually review raw log files to determine what changed. Variphy provides proactive visibility with searchable audit logs, configuration snapshots, and alerts on key change events.

Audit Log Reporting

- **Gain** full visibility into configuration and administrative changes across all CUCM nodes.
- **Monitor** activity with a dashboard widget for ongoing monitoring.
- **Accelerate** troubleshooting of configuration-related issues with change event alerting.
- **Eliminate** manual log reporting through automation.

Change Management & Snapshots

- **View** baseline and archived configuration snapshots at any point in time.
- **Audit** node moves, adds, and changes with full history.
- **Compare** past vs. present settings.
- **Archive and search** node-level audit logs.
- **Identify** unregistered phones to reduce unnecessary hardware maintenance.

As-Built Configuration Reporting

- **Report** on phone registration status and serial numbers across the environment.
- **Generate** real-time or historical configuration reports on demand.
- **Filter** via cluster-wide or custom-defined criteria.
- **Export** reports in PDF, CSV, or Microsoft Word/RTF format.

Why Variphy?

Proactive Change Visibility

Move beyond reactive CUCM log reviews with searchable audit logs and alerts on key system events.

Faster Troubleshooting

Quickly pinpoint changes that may be causing issues.

Improved Governance

Monitor administrative activity and support compliance efforts

Automated Documentation

Generate accurate as-built reports without manual work.
